

CSE101 – Introduction to Computers

Python Programming Assignment # 2

(25 points, Submission due date: 5 April 2019)

Instructions

For each of the following problems, create an error free efficient Python program. Each program should be submitted in a separate Python file respectively that follows a particular naming convention. (E.g. The Python program for Question 1 should be in .py file with name Assign2Answer1.py. The Python program for question 2 should be in .py file with name Assign2Answer2.py. Include one or two input cases in your program. The program should execute properly in PyCharm).

Problems

Problem 1:

(6 points)

Write a Python program that uses function ***def printAsteriskPattern(num_rows)*** to construct the following pattern, using a nested for loop. The function receives as input the number of rows (both, even and odd) in a pattern. In case the number of rows is odd, the number of asterisks in the middle row are: $\text{math.ceil}(\text{num_rows}/2)$. In case the number of rows is even, there are two middle rows with the number of asterisks $\text{math.ceil}(\text{num_rows}/2)$ as shown in the following:

```
>>>printAsteriskPattern(9)
```

```
*
* *
* * *
* * * *
* * * * *
* * * *
* * *
* *
*
```

```
>>>printAsteriskPattern(10)
```

```
*
* *
* * *
* * * *
* * * * *
* * * *
* * * *
* * *
```

```
* *  
*
```

Problem 2:

(6 points)

A sieve function from PythonLabs takes as input any positive number and prints a list of prime numbers less than the given number. E.g.

```
>>> from PythonLabs.SieveLab import *  
  
>>> sieve(50)  
  
[2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47]
```

Write a function named **`def num_primes(num_list)`** that prints a table that shows how many primes are less than n for various values of n in a num_list. The argument to your function should be a list of numbers to use for n, and the output should be a set of lines that shows the value of n and the number of primes less than n. You can make use of PythonLabs sieve function in your program.

```
>>> num_primes ([10, 100, 1000, 10000, 100000])  
  
10 4  
100 25  
1000 168  
10000 1229  
100000 9592
```

Problem 3:

(6 points)

A prime pair is a set of two numbers that are both prime and that differ by 2. For example, 599 and 601 are a prime pair. Write a function named **`def prime_pairs(num)`** that prints all the prime pairs less than a specified value. You can make use of PythonLabs sieve function in your program.

```
>>> prime_pairs(50)  
  
3 5  
5 7  
11 13  
17 19  
29 31  
41 43
```

Problem 4:

(7 points)

ASCII stands for American Standard Code for Information Interchange. Computers can only understand numbers, so an ASCII code is the numerical representation of a character such as 'a' or '@' or an action of some sort. Refer to the ASCII table shown in the following:

ASCII Table

| Dec | Hex | Oct | Char | Dec | Hex | Oct | Char | Dec | Hex | Oct | Char | Dec | Hex | Oct | Char |
|-----|-----|-----|------|-----|-----|-----|---------|-----|-----|-----|------|-----|-----|-----|------|
| 0 | 0 | 0 | | 32 | 20 | 40 | [space] | 64 | 40 | 100 | @ | 96 | 60 | 140 | ` |
| 1 | 1 | 1 | | 33 | 21 | 41 | ! | 65 | 41 | 101 | A | 97 | 61 | 141 | a |
| 2 | 2 | 2 | | 34 | 22 | 42 | " | 66 | 42 | 102 | B | 98 | 62 | 142 | b |
| 3 | 3 | 3 | | 35 | 23 | 43 | # | 67 | 43 | 103 | C | 99 | 63 | 143 | c |
| 4 | 4 | 4 | | 36 | 24 | 44 | \$ | 68 | 44 | 104 | D | 100 | 64 | 144 | d |
| 5 | 5 | 5 | | 37 | 25 | 45 | % | 69 | 45 | 105 | E | 101 | 65 | 145 | e |
| 6 | 6 | 6 | | 38 | 26 | 46 | & | 70 | 46 | 106 | F | 102 | 66 | 146 | f |
| 7 | 7 | 7 | | 39 | 27 | 47 | ' | 71 | 47 | 107 | G | 103 | 67 | 147 | g |
| 8 | 8 | 10 | | 40 | 28 | 50 | (| 72 | 48 | 110 | H | 104 | 68 | 150 | h |
| 9 | 9 | 11 | | 41 | 29 | 51 |) | 73 | 49 | 111 | I | 105 | 69 | 151 | i |
| 10 | A | 12 | | 42 | 2A | 52 | * | 74 | 4A | 112 | J | 106 | 6A | 152 | j |
| 11 | B | 13 | | 43 | 2B | 53 | + | 75 | 4B | 113 | K | 107 | 6B | 153 | k |
| 12 | C | 14 | | 44 | 2C | 54 | , | 76 | 4C | 114 | L | 108 | 6C | 154 | l |
| 13 | D | 15 | | 45 | 2D | 55 | - | 77 | 4D | 115 | M | 109 | 6D | 155 | m |
| 14 | E | 16 | | 46 | 2E | 56 | . | 78 | 4E | 116 | N | 110 | 6E | 156 | n |
| 15 | F | 17 | | 47 | 2F | 57 | / | 79 | 4F | 117 | O | 111 | 6F | 157 | o |
| 16 | 10 | 20 | | 48 | 30 | 60 | 0 | 80 | 50 | 120 | P | 112 | 70 | 160 | p |
| 17 | 11 | 21 | | 49 | 31 | 61 | 1 | 81 | 51 | 121 | Q | 113 | 71 | 161 | q |
| 18 | 12 | 22 | | 50 | 32 | 62 | 2 | 82 | 52 | 122 | R | 114 | 72 | 162 | r |
| 19 | 13 | 23 | | 51 | 33 | 63 | 3 | 83 | 53 | 123 | S | 115 | 73 | 163 | s |
| 20 | 14 | 24 | | 52 | 34 | 64 | 4 | 84 | 54 | 124 | T | 116 | 74 | 164 | t |
| 21 | 15 | 25 | | 53 | 35 | 65 | 5 | 85 | 55 | 125 | U | 117 | 75 | 165 | u |
| 22 | 16 | 26 | | 54 | 36 | 66 | 6 | 86 | 56 | 126 | V | 118 | 76 | 166 | v |
| 23 | 17 | 27 | | 55 | 37 | 67 | 7 | 87 | 57 | 127 | W | 119 | 77 | 167 | w |
| 24 | 18 | 30 | | 56 | 38 | 70 | 8 | 88 | 58 | 130 | X | 120 | 78 | 170 | x |

In Python, you can use a function **chr(num)** to print character corresponding to a specific ASCII number. E.g.

```
>>> chr(65)
```

```
'A'
```

Similarly, a character can be converted to ASCII number using a function **ord(character)**. E.g.

```
>>> ord('A')
```

```
65
```

Write a function named **def asciiPyramid(num_lines)** which will print a pyramid of ASCII characters for the specific number of lines. Check for the following condition: num_lines should be more than 0 and less than 14. The top of the pyramid is ascii character '!' which can be printed using function chr(33).

```
>>> asciiPyramid(6)
```

!
" #
\$ % &
' () *
+ , - . /
0 1 2 3 4 5

>>>asciiPyramid(13)

!
" #
\$ % &
' () *
+ , - . /
0 1 2 3 4 5
